

WhatsApp-Native Service Agreement & USDC Off-Ramp Bridge

Securing peer-to-peer trade and social commerce for emerging markets.

The Problem: Trust Deficit & Payment Friction

Pay-Before-Delivery (PBD) Risk:

Buyers fear upfront payment scams. This trust barrier causes friction, lowering transaction success rates and cart conversions for merchants.

Cash-on-Delivery (CoD) Waste:

Up to 30% of physical orders are rejected at the buyer's doorstep. Sellers are forced to absorb double shipping costs, killing thin margins.

Global Settlement Barriers:

Local freelancers and creators face massive delays, expensive intermediaries, and heavy fees when receiving international contract payouts.

Web3 Onboarding Complexity:

Standard crypto wallets, gas tokens, seed phrases, and manual exchanges are too complex and high-friction for general market audience adoption.

RISK: Pay-Before-Delivery

WASTE: Cash-on-Delivery (30%)

COMPLEXITY: Crypto Wallets

Why Now? The Perfect Convergence

1. WhatsApp Interactive APIs

The transition from open-text parsing to native button elements allows guided transaction lifecycles. Users execute complex service agreement stages with zero typing errors.

2. High-Performance Networks

Sub-cent transaction fees and near-instant finality on modern EVM-compatible chains make micro-service agreement smart contracts commercially viable and user-friendly.

3. Stablecoin Banking Rails

Regulated stablecoin-to-fiat API gateways (USDC liquidity nodes) have matured globally, supporting direct payouts to local bank accounts instantly.

The Solution: Service Agreement Natively in Chat

Built Inside Daily Workflows:

No external apps, logins, or seed phrases. The entire transactional relationship happens directly within the user's primary chat screen.

Naira Service Agreement Layer (Live Today):

Fully functional local currency service Agreement routing, managing counterparty terms and payments via licensed gateways.

Structured Management Console:

Service Agreement admins monitor delivery proofs, track timestamps, and resolve disputes fairly using our custom dashboard at sivantech.online.

Stablecoin Integration: Invisible Web3

USDC Smart Escrows:

Secure, non-custodial smart contracts govern the service agreement. Assets are locked programmatically and released or returned purely based on counterparty approval.

Automated Off-Ramping:

Upon contract release, smart contract logic triggers the conversion of USDC directly to fiat currency via regional liquidity API partners.

The Zero-Knowledge Advantage:

Buyers secure deals with USDC on-chain; sellers receive local bank payouts directly. Neither party needs to manage gas, private keys, or wallet configuration.

Market Opportunity: Social Commerce & Freelancers

50 Million+

Active WhatsApp Users

Nigeria's primary business channel. Thousands of merchants, boutique sellers, and local service providers coordinate transactions inside daily chats.

10 Million+

Freelancers & Creators

A rapidly growing class of remote digital service workers seeking secure, low-friction channels to process international contract payments.

\$20 Billion+

P2P Trade Market

Unlocking secure stablecoin micro-escrows opens safe P2P purchasing, escrowed digital asset exchanges, and global remittances.

Competitive Advantage: Built for Daily Habit

FEATURE / CHANNEL	TRADITIONAL PBD / COD	WEB ESCROW SITES	SIVAN (OUR SOLUTION)
Transaction Friction	Medium (Manual trust agreement)	High (Signup forms, external sites)	Zero (Native WhatsApp buttons)
Financial Safety	None (High fraud/refusal loss)	High (Funds locked on platform)	High (Smart contract secure lock)
Payout Speed	Variable (Days for cash collection)	Slow (Days of processing delays)	Instant (USDC to local bank API)
Setup Complexity	Low (Basic chat/phone agreement)	High (Mandatory profile setups)	Zero (No app installation required)

Security & Compliance: Trust and Safety

Non-Custodial Architecture:

Sivan does not hold, manage, or store user funds directly. Assets remain securely locked within code-governed on-chain smart contracts or regulated banking providers.

Regulated Off-Ramping Gateways:

All crypto-to-fiat transactions and local banking settlements are delegated to fully licensed Payment Service Providers (PSPs) who enforce ultimate local compliance and KYC.

Dispute & Fraud Mitigation:

Structured digital delivery trails, timestamps, and multi-signature release conditions protect counterparties and prevent single-sided exit scams.

SECURE ARCHITECTURE

Non-Custodial Service Agreement

Roadmap: Execution & Expansion Timeline

Phase 1: Foundation (Live in Production)

- WhatsApp chat engine integration.
- Automated interactive templates.
- Local NGN service agreement routing.
- Custom admin dispute center.

Phase 2: Wallet Integration (Next Phase)

- Hosted wallet API integration.
- Stablecoin lock & release tracking.
- Gas fee abstraction/sponsorship.
- Real-time ledger synchronization.

Phase 3: Off-Ramp Bridge (Expansion)

- USDC-to-fiat API connections.
- Automated local bank payouts.
- Support for regional currencies.
- Multi-party payment settlements.

The Team: Founders Behind Sivan

Michael Samson Founder

Responsible for product leadership, business direction, technology execution, compliance ownership, and payment partner coordination. Over 6 years of experience building secure transaction routing and conversational bot engines.

Jonathan Hart Co-Founder & Operations Partner

Responsible for operational support, partner coordination, pilot onboarding, customer support workflows, internal control systems, and coordinating local banking integrations.

Let's Build the Future of Chat Commerce

Integrate secure, zero-friction stablecoin escrows directly into daily messaging channels.
Sivan makes digital P2P trade safe, instant, and accessible for everyone.
